Primary / Merged (CPU/PCH) Micro2-XDP

PCH XDP Signals

These signals do not connect to the Primary (Merged) XDP connector in this architecture. The PDG puts them on a secondary XDP connector that is only needed in some PCH debugging situation. They are listed here to show their secondary XDP functions and to provide test points for signals that are not used elsewhere.

Non-XDP Signals

Unused GPIOs have TPs.  
 USB Overcurrents are aliased, do not cause USB OC# events during PCH debug.  
 JTAG\_ISP (non-TMS) nets are aliased, do not attempt bit-banged JTAG during PCH debug.

### System 32kHz / 12MHz / 24MHz Clock Generator

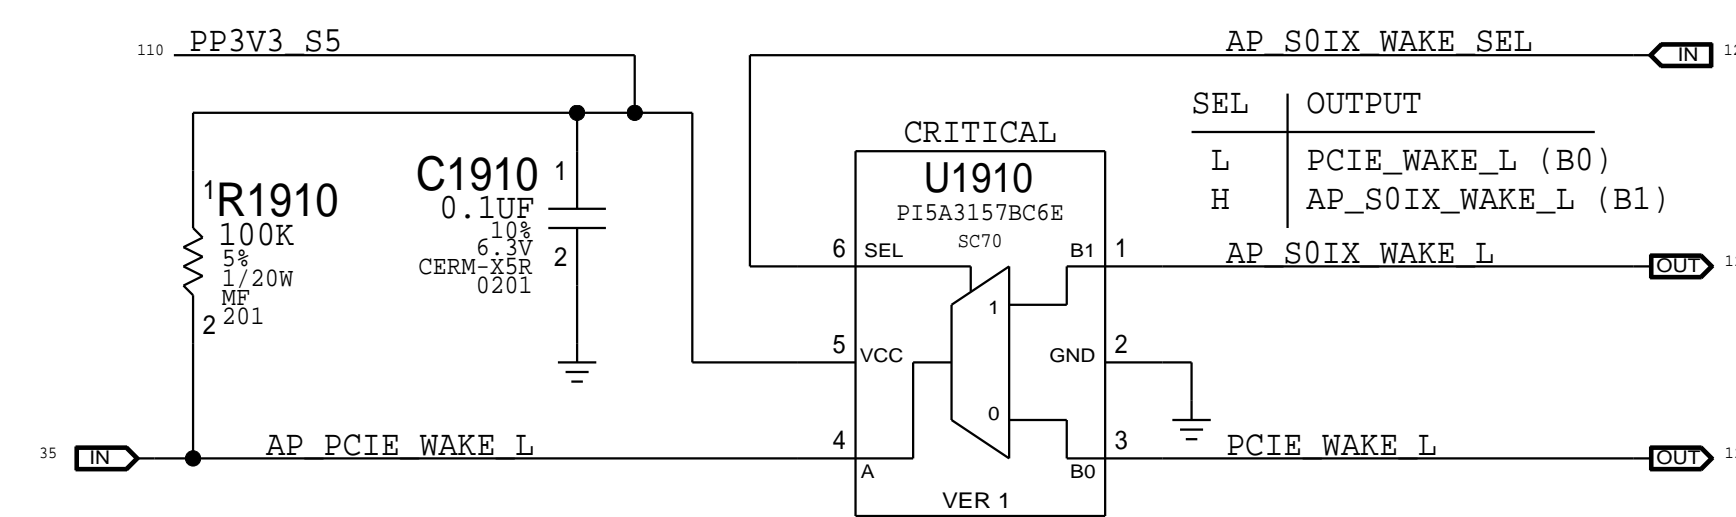

### PCH ME Disable Strap

PCH uses HDA\_SDO as a power-up strap. If low, ME functions normally. If high, ME is disabled. This allows for full re-flashing of SPI ROM. SMC controls strap enable to allow in-field control of strap setting. \*\*\*\*\* Circuit does not support HDA voltage >3.3V.
